ITB is the verified member of The European Platform for EPD program operators and LCA practitioner www.eco-platform.org

Basic information

This declaration is the Type III Environmental Product Declaration (EPD) based on EN 15804+A2 and verified according to ISO 14025 by an external auditor. It contains the information on the impacts of the declared construction materials on the environment and their aspects verified by the independent body according to ISO 14025. Basically, comparison or evaluation of EPD data is possible only if all the compared data were created according to EN 15804+A2.

Life cycle analysis (LCA): A1-A3, A4-A5 and D modules in accordance with EN 15804

(Cradle-to-Gate with options)

The year of preparing the EPD: 2023

Product standard: PN EN 1090-2

Service Life: 100 years

PCR: ITB-PCR A

Declared unit: 1 ton

Reasons for performing LCA: B2B

Representativeness: Poland, European, 2022

MANUFACTURER

EXBUD Konstrukcje company, is located in Peryferyjna Street in Kielce (Poland) and in Köln (Germany) in the field cross-border business activities in Germany. The company is a manufacturer of steel structures and steel elements specialized in the production and processing of steel components and the assembly of structures based on steel solutions, including steel devices and machines. Steel structures being produced are applied to civil and industry construction industry and infrastructure. The annual manufacturing capacity is 12 000 tonnes of steel

structures depending on types of projects being made. At EXBUD Konstrukcje Sp. z o.o., steel structures are manufactured in accordance with the individual workshop design provided by the client, so the products are unique, adapted to the architectural requirements and installation conditions imposed by the client. Dimensions, type of applied corrosion protection and color of finished elements are different for different projects, and the product is often treated as a one-off. A common feature of the products manufactured by the EXBUD plat is the material from which they are made, i.e. steel, and the standard according to which they are made - PN-EN 1090-2. Steel construction is used to the following objects: production and processing plants, halls, warehouses, logistics and shopping centers, bridges, viaducts, footbridges, public utility facilities, sports, infrastructure and hydro-engineering facilities, facilities for aviation.

PRODUCTS DESCRIPTION

The steel products covered by this EPD have a number of different applications in construction sector. The actual technical documents related to the products are available on [website](#). Set of products covered by this EPD is shown in Table 1.

Table 1. Construction steel products offered by EXBUD konstrukcje Sp. z o.o.

Product types	Grade	Standard
Bars, angles, T-bars	S235/S355	EN 1090-2
Steel columns	S235/S355	EN 1090-2
Construction sections	S235/S355	EN 1090-2

Selected products (Table 1) are commonly used as: prefabricated elements, construction objects such steel structures, buildings/halls skeletons, pressure equipment, machines and mining supports. These products are manufactured in a variety of grades and specifications to comply with national and international quality certifications as well as to meet stringent customer specifications.

LIFE CYCLE ASSESSMENT (LCA) – general rules applied

Unit

The declared unit is 1 ton of product.

System boundary

The life cycle analysis of the declared products covers “Product Stage” A1-A3, A4, C2-C4+D modules in accordance with EN 15804 and ITB PCR A (cradle to gate with options). Energy and water consumption, emissions as well as information on generated wastes were inventoried and were included in the calculation. It can be assumed that the total sum of omitted processes does not exceed 5% of all impact categories. In accordance with EN 15804+A2, machines and facilities (capital goods) required for the production as well as transportation of employees were not included in LCA.

Allocation

The allocation rules used for this EPD are based on general ITB’s document PCR A. Production of the covered steel products is a line process (as presented in Figure 1) conducted in the manufacturing plant located in Kielce (Poland). Input and output data from the production is inventoried and allocated to the production on the mass basis. The declaration covers a wide range of steel products. Their production resources and processing stages are basically similar, so it is possible to average the production by product weight.

System limits

Minimum 99.0% input materials and 100% energy consumption (electricity, gas, LPG, other) were inventoried in a processing plant and were included in the calculation. In the assessment, all significant parameters from gathered production data are considered, i.e. all material used per formulation, utilized thermal energy, and electric power consumption, direct production waste and available emission measurements. Tires consumption for transport was not considered. Substances with a percentage share of less than 0.1% of total mass were excluded from the calculations. The packaging products (wooden pallets) are included.

Modules A1 and A2: *Raw materials supply and transport*

The modules A1 and A2 represent the extraction and processing of raw materials (mainly steel elements) and transport to the production site. The steel sheets are semi-products commonly used to produce prefabricated elements, skeleton frames, steel structures. Steel used come from a specific suppliers producing steel with EAF technology and BOF. For A2 module (transport) European averages for fuel data are applied.

Module A3: *Production*

The product specific manufacturing process line is presented in Figure 1, an input steel/semi-product is processed to a dedicated shape. Electricity are consumed in the process. The products are galvanized using two hot-dip and immersion methods, and painted. In the production process, technical gases and materials for welding elements are used. The production process is depicted schematically as can be seen below.

Type III Environmental Product Declaration No. 507/2023

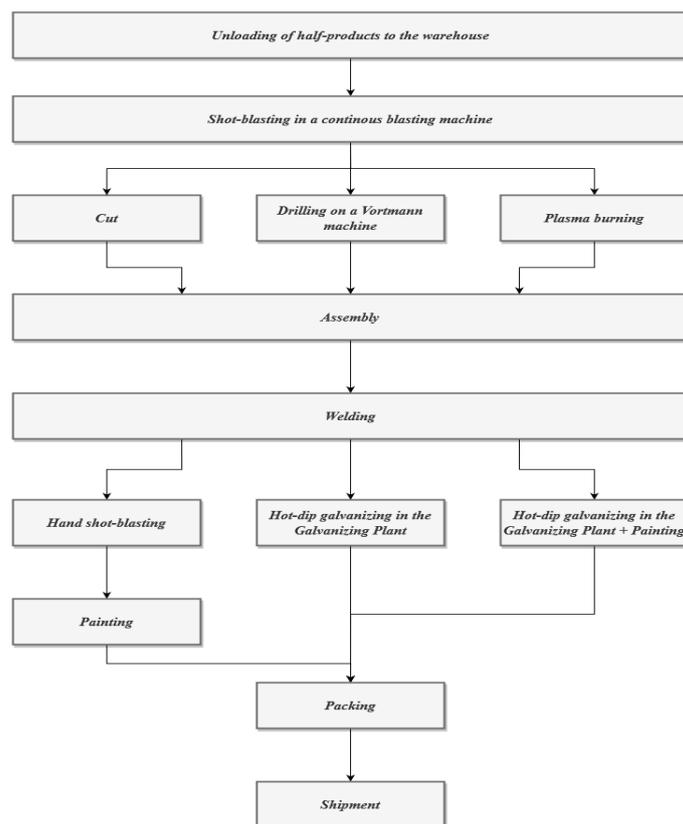

Figure 2 Manufacturing process scheme (A3)

Module A4: transport to consumer

Vehicle transport at distance 700 km is considered (emission standard: Euro 5) with 100% load capacity.

Modules C and D: End-of-life (EOL)

Due to the fact that the declaration covers a wide range of steel products for various purposes and usage scenarios, it is not possible to directly specify the de-construction technology and the amount of energy for disassembly in C1 module (so this module is very generic based on literature). In the adapted end-of-life scenario, the de-constructed steel products are transported to a steel mill distant by 100 km on > 16t lorry EURO 5 where are used as steel scrap to produce a new steel. The recycling potential of C3 module is 98% and it is assumed that only 2% of the products will end up in a landfill – C4 module (Table 2). Module D presents credits resulting from the recycling of the steel scrap (used for steel production), calculated in accordance with the approach developed by World Steel Association.

Table 2. End-of-life scenario for the steel products

Material	Material recovery	Recycling	Landfilling
Steel scrap	100%	98%	2%

Electricity at end-of-life (module C) has been modelled using an average Polish electricity mix as the location where the product reaches end-of-life is unknown.

Data collection period

The data for manufacture of the declared products refer to period between 01.01.2022 – 31.12.2022 (1 year). The life cycle assessments were prepared for Poland and Europe as reference area.

Type III Environmental Product Declaration No. 507/2023

Data quality

The data selected for LCA originate from ITB-LCI questionnaires completed by EXBUD Konstrukcje Sp. z o.o. and verified during data audit. No data collected is older than five years and no generic datasets used are older than ten years. The representativeness, completeness, reliability, and consistency is judged as good. The background data for the processes come from the following resources database Ecoinvent v.3.9.1 (steel, welding, paints, solvents, foil, paper and carton, EUR-flat pallet, structural timber). Specific (LCI) data quality analysis was a part of the input data verification. Where no background data was available, data gaps were complemented by manufacturer information and literature research.

Assumptions and estimates

The impacts of the representative products were aggregated using weighted average.

Calculation rules

LCA was performed using ITB-LCA tool developed in accordance with EN15804+A2. Emission of greenhouse gases was calculated using the IPCC 2013 GWP method with a 100-year horizon. Emission of acidifying substances, Emission of substances to water contributing to oxygen depletion, Emission of gases that contribute to the creation of ground-level ozone, Abiotic depletion, and ozone depletion emissions where all calculated with the CML-IA baseline method

Additional information

Polish electricity (Ecoinvent v 3.9.1 supplemented by actual national Kobize data) emission factor used is 0.702 kg CO₂/kWh. As a general rule, no particular environmental or health protection measures other than those specified by law are necessary.

LIFE CYCLE ASSESSMENT (LCA) – Results

Declared unit

The declaration refers to declared unit (DU) – 1 ton of Steel structures produced in Europe. The following life cycle modules (Table 1) were included in the analysis. The following tables 2-5 show the environmental impacts of the life cycle of selected modules (A1-A5+C1-C4+D).

Table 3. System boundaries for the environmental characteristic of the product.

Environmental assessment information (MD – Module Declared, MND – Module Not Declared, INA – Indicator Not Assessed)																
Product stage			Construction process		Use stage							End of life				Benefits and loads beyond the system boundary

Type III Environmental Product Declaration No. 507/2023

Verification

The process of verification of this EPD is in accordance with ISO 14025 and ISO 21930. After verification, this EPD is valid for a 5-year-period. EPD does not have to be recalculated after 5 years, if the underlying data have not changed significantly.

The basis for LCA analysis was EN 15804 and ITB PCR A	
Independent verification corresponding to ISO 14025 (sub clause 8.1.3.)	
<input checked="" type="checkbox"/> external	<input type="checkbox"/> internal
External verification of EPD: Halina Prejzner, PhD. Eng. LCI audit and verification: Michał Chwedaczuk, M.Sc. Eng. LCA, LCI audit and input data verification: Michał Piasecki, PhD., D.Sc., eng.	

Note 1: The declaration owner has the sole ownership, liability, and responsibility for the for the information provided and contained in EPD. Declarations of construction products may not be comparable if they do not comply with EN 15804+A2. For further information about comparability, see EN 15804+A2 and ISO 14025.

Note 2: Note: ITB is a public Research Organization and Notified Body (EC Reg. no 1488) to the European Commission and to other Member States of the European Union designated for the tasks concerning the assessment of building products' performance. ITB acts as the independent, third-party verification organization (ISO 17025/17065/17029). ITB-EPD program is recognized and registered member of The European Platform - Association of EPD program operators and ITB-EPD declarations are registered and stored in the international ECO-PORTAL.
